Alvetex® Strata Quick Start Protocol

Alvetex Strata Formats:

Alvetex Strata is currently available in the following formats; 12-well inserts and 6-well inserts, suitable for short or long term experiments, as well as co-culture and air/liquid interface set-ups. Inserts are compatible with standard tissue culture plates and with Reinnervate’s well insert holder in a deep Petri dish, designed for demanding cell types to provide increased volumes of culture media. 12-well inserts fit into both 6- and 12-well plates (to fit into 12-well plates the extended arms must be snapped off). When deciding which Alvetex Strata format to use, the following factors should be considered in combination:

- Cell type and duration of experiment;
- The desired depth of cell penetration into or height of cell multilayer on top of the 3D substrate;
- The type of assay or end point analysis to be performed.

Notes Before Starting:

- Alvetex Strata is supplied sterile by gamma-irradiation and remains sterile until opened.
- Always handle Alvetex Strata with care, using gloves. Flat-ended forceps are recommended.
- Prior to use, Alvetex Strata must be rendered hydrophilic with a 70% ethanol wash; add enough ethanol to completely cover the disc, remove, and wash 2x with appropriate culture media. To avoid drying, leave the disc in the final medium wash until required.

Seeding Cells on Alvetex Strata:

For optimal results, cells should be seeded dropwise evenly over the entire surface of the scaffold in appropriate media. As a number of cell types prefer to multilayer on top of Alvetex Strata rather than penetrate into it, media should be added below the insert to avoid cells drying out during the initial attachment period and above the insert to encourage even seeding over the entire surface of the scaffold. See Table 1, Figure 2 and Table 2 for specific details for each format.

In brief, when inoculating, aspirate off the wash medium thoroughly from the plate, add medium to the culture well to below and above the insert separately and carefully dispense cells dropwise all over the disc. Replace the lid and incubate at room temperature for at least 30 min to facilitate cell attachment, then transfer to a humidified incubator at 37 °C with 5 % CO₂ overnight to complete cell attachment.

After this time, gently flood the wells with medium to the desired level, see Figure 2 and Table 2 for specific details for each format. With 3D cell culture there are likely to be many more cells growing per unit volume of medium, therefore media changes may be required more frequently than with 2D cultures.

Monitoring Cell Attachment and Growth via Light Microscopy:

Cell culture in Alvetex Strata allows the formation of multilayered, high-density cell populations which approximate the complexity and structure of in vivo tissues. When viewing an unstained, unsectioned Alvetex Strata 3D culture under a standard brightfield microscope, the combined...
density and thickness of the substrate and the 3D culture within it prevent the clear visualisation of individual cells. However, to overcome this, common visible dyes such as Neutral Red staining solution can be successfully used to confirm cell attachment or to check confluency (Figure 1).

Figure 1. Microscopic appearance of CaCo2 cells (a human colorectal adenocarcinoma cell line) seeded on Alvetex Strata 12-well inserts in 12-well plates after 24 hours as visualised by Neutral Red staining. Scale bars 100 μm. Note the increase in staining intensity with higher cell numbers.

Different cell types show alternative 3D cell growth patterns on Alvetex Strata 6-well insert format

Alvetex Strata in the 6-well insert format was prepared in a 6-well plate as described above. HepG2 cells (a human hepatocarcinoma cell line) and 3T3 cells (a mouse fibroblast cell line) were plated at a density of $1 \times 10^6$ cells per insert. Plates were maintained for 4 days. After preserving in Bouins fixative the discs were paraffin embedded, sectioned (10 μm) and counterstained following the haematoxylin and eosin protocol available at reinnervate.com. HepG2 cultures predominantly multilayered on top of the matrix, while 3T3 cells invaded into the whole thickness of the matrix. (Figure 3).

It is important to note that the same number of cells were cultured on Alvetex Strata, for the same growth period, yet very different growth patterns resulted with these two cell types.

*Figure 3. Comparison of the 3D cell growth patterns of HepG2 and 3T3 cells on Alvetex Strata 6-well insert format. Scale bars 100μm.*
Alvetex® Strata Quick Start Protocol

Comparison of the 3D cell growth characteristics of cells cultured on Alvetex Strata presented in various formats

CaCo2 cells were seeded (0.5 × 10^6 cells per well) on Alvetex Strata in the following formats: 12-well inserts in 12-well plate, 12-well inserts in 6-well plate and 12-well inserts in well insert holder in deep Petri dish. Cultures were maintained for 7 days. After preserving in Bouins fixative, the discs were paraffin embedded, sectioned (10 μm) and counterstained with Haematoxylin and Eosin.

Figure 4. Comparison of 3D cell growth patterns of CaCo2 cells grown on various Alvetex Strata formats. Scale bars 100 μm.

The way in which Alvetex Strata is presented can significantly influence the growth characteristics of the cell culture. Here we demonstrate how CaCo2 3D culture is influenced by the vessel and media volume. (Figure legend continues on next page ...)

For research use only. Not for use in diagnostic procedures.
Note that the same number of cells were cultured on Alvetex Strata, for the same growth period, yet significantly more proliferation and multilayering resulted on top of Alvetex Strata as the well-size and the medium volume increased, due to greater nutrient availability from above and below the insert. In the case of well inserts contained in a well insert holder in a deep Petri dish, this resulted in the formation of a slab of tissue-like material. During the culture period, media was interconnected as detailed in Figure 2 above and changed fully every 2-3 days, in volumes of 4 ml per well of a 12-well plate, 10 ml per well of a 6-well plate and 75 ml per deep Petri dish.

Technical Support

To obtain the latest technical support information, please visit http://www.amsbio.com/alvetex-3D-cell-culture.aspx

You can have 24-hour access to the following information:

- Access to telephone and fax information for order support
- Search through the protocol video gallery
- Search product spec sheets, protocols, applications notes and product support docs
- Obtain information on customer training and workshops
- Submit a question directly to Technical Support at info@amsbio.com
